

# EvidenceDesk

Local AI code review  
with exact source evidence

Aleksei Solonskii / Alex SOLONSKY

Local prototype, September 2026

# The review problem

## A plausible explanation can still be wrong

### Reference error

The cited line is missing  
or points to a different change.

### Reasoning error

The line exists, but the claim  
goes beyond what it shows.

Intended users: developers reviewing small Git changes.

# The review workflow

**The reviewer makes the final judgment.**

The exported record keeps the claims and the evidence together.

# One observation, two source lines

Synthetic example diagram

**access.py, old line 20**

if user.is\_admin:

**access.py, new line 20**

if user.is\_admin or allow\_preview:

AI observation

**The condition adds  
“or allow\_preview”.**

Both old and new evidence IDs  
exist in the exported record.

Runtime effects depend on omitted context, including the value of allow\_preview.

# Local architecture

Diffs remain data. The app does not execute them or persist them.

Missing local inference produces an explicit unavailable state.

# Development evidence

27

automated checks  
passed

9

real local-model  
responses

24

claims manually  
assessed

## 4 selected final runs contain 10 observations

The same AI agent authored the fixtures and assessed the responses.  
Selection followed iteration across two prompt versions.

**Small synthetic QA only. No independent accuracy benchmark.**

# The validation boundary

**A real failure remains in the audit trail**

**“The file old name.py had no trailing newline at line 11.”**

The response cited a real record,  
but misread its EOF evidence.

**semantic\_truth\_checked = false**

**Reference validity does not establish semantic truth.**

Changed text only  
Omitted runtime context  
Model errors remain possible  
User impact unmeasured

# Next evaluation

## Unfamiliar diffs

Record expected facts before independent review.

## Reviewer study

Measure whether evidence helps people correct misleading claims.

## Product QA

Exercise keyboard access, responsive layouts and omitted context.

## Demonstration

CLI demo available. Browser UI recording pending.

[View CLI demonstration \(3:40\)](#)
